
CODE CLINIC BOOKING SYSTEM DEMO

A presentation by Group 6

OVERVIEW

This presentation gives an overview on our booking system. We were tasked with creating a program that calls a google api to retrieve and send events to users. It is ran from the terminal and creates a booking event between a struggling or in-need student with a willing knowledgeable volunteer.

Project goals and specifications

- **Command Line Tools:** The code runs on linux

It takes command-line arguments as input

Has a help command that displays said arguments

Provides a file output stored as a JSON file

- **Goals:** Configure the system to connect the calendars and store the configuration information in a hidden folder

- Allow users (both the student and volunteer) to make and cancel bookings
- **Restrictions:** Students cannot cancel empty or someone else's slot
- Volunteers cannot cancel booked slots or slots that don't belong to them

CHALLENGES

Using an api for the first time

Implementing the code that calls the api

Debugging the program

Organising work flow in terms of schedules
and team member availability

Personal overviews and overall experiences
